B.Sc. University of California, San Diego 2014-2017 Computer Science

PERSONAL PROJECT

Financial Trading App (github.com/camjoe/trading)

March 2026 - Present

- Developed a Python algorithmic-trading platform with automated trading through online broker paper accounts.
- Designed and enforced a layered architecture (interfaces → services → repositories/domain → database).
- Integrated a broker execution API (two IBKR transports behind one interface) and multiple market-data and alternative-data feeds (news/Google Trends) behind pluggable, factory-selected adapters.
- Created an Alembic migration lifecycle (schema versioning, reversible up/down migrations) and a unit-of-work layer that wraps multi-write operations in atomic commits.
- Directed Claude's coding agent to generate much of the codebase, reviewing every change and gating each pull request with automated GitHub Actions checks (architecture-convention enforcement, docs-drift detection, test coverage).
- Made live order submission crash-safe: each order is persisted with a client-order-id before it's sent, so a crash or timeout can't double-place it, and a reconciliation pass recovers any order whose broker response was lost.

EXPERIENCE

Superior Court of San Bernardino

September 2024 - Present

Application Developer II

- Built end-to-end applications supporting court operations for San Bernardino County, the largest county in the contiguous U.S. (~2.2M residents), spanning multiple courthouses and county agencies.
- Engineered the application stack in C#, ASP.NET Core, Entity Framework Core, and TypeScript, backed by SQL Server databases tuned with T-SQL and indexing.
- Leveraged GitHub Copilot's coding agent to automate code reviews, generate Python scripts powering CI checks (through GitHub Actions), and accelerate feature development.
- Stabilized a critical budget request system by implementing improved validation, structured logging, and monitoring, reducing error reports from ~500 per week to under 20 and improving incident response times.

Vyant Bio (aka Stemonix) · Biotech / drug discovery

December 2020 - January 2023

Software Engineer (Backend-Focused)

- Introduced Python to the team and ported proprietary biological image and Excel analysis code from MATLAB.
- Built an S3-triggered Lambda pipeline that processed incoming image and Excel data, wrote it to PostgreSQL, then loaded it into the Databricks lakehouse.
- Packaged the ported code as a Python wheel of callable methods in Databricks notebooks, allowing data scientists and biologists to work in one environment.
- Delivered the migration in stages against set deadlines to prove value at each step.
- Collaborated with scientists to translate research requirements into backend architecture and data ingestion systems.

Software Engineer (Full Stack) — Housecall Pro

Feb 2019 - Nov 2019

Software Engineer (Full Stack) — Axure Software Solutions

Jun 2017 - Jan 2019

Software Engineer Internship — Amazon Lab126

Jun 2016 - Sep 2016

SKILLS

Languages: Python (Pandas/Numpy), C#, TypeScript, SQL

Backend & frameworks: FastAPI, ASP.NET Core, Entity Framework Core, REST API design

Architecture & design: layered/clean architecture, SOLID, service-oriented design

Testing & quality: pytest, mypy, Ruff, integration testing, code & architecture review, ADRs (technical documentation)
